`rinoh.frontend.sphinx` is a Sphinx extension module. It provides a Sphinx builder with the name `rinoh`. The builder recognizes the following `conf.py` options. Of these, only `rinoh_documents` (or `latex_documents`) is required.

## `rinoh_documents`

Determines which PDF documents to build. Its format is a list of dictionaries, one for each document to be generated. The supported keys for these dictionaries are listed below. Two of them are required:

### `doc` (required)

String that specifies the name of the master document (typically `index`).

### `target` (required)

The name of the target PDF file without the extension.

The following keys allow overriding the content included on the document's title page and page headers/footers (depending on the template and its configuration). The values for text content can be plain text or `StyledText`.

### `logo` (no default)

Path (absolute or relative to the location of the `conf.py` file) to an image file, typically included on the title page.

### `title` (default: “`project documentation`”)

The title of the document.

### `subtitle` (default: “`Release release`”)

Subtitle of the document.

### `author` (default: “`author`”)

The document's author.

### `date` (default: determined from `today` and `today_fmt`)

The document (build) date.

The remaining keys control what is included in the document and the document template (configuration) to use.

### `toctree_only` (default: `False`)

Must be `True` or `False`. If true, the document itself is not included in the output, only the documents referenced by it via TOC trees.

### `domain_indices` (default: `True`)

If true, generate domain-specific indices in addition to the general index. It is equivalent to the `html_domain_indices` and `latex_domain_indices` configuration variables.

### `template` (default: `Book`)

Determines the template used to render the document. It takes:

- the filename of a template configuration file,
- a `TemplateConfiguration` instance,

- the name of an installed template (see `rinoh --list-templates`), or
- a `DocumentTemplate` subclass

`rinoh_documents` will also accept other keys than those listed above. These items will be available as document metadata and can be used in a custom document template.

Example:

```
rinoh_documents = [
    dict(doc='index', target='manual', toctree_only=False,
         template='manual.rtt', logo='logo.pdf'),
    dict(doc='ref', target='reference', title='Reference Manual',
         template='reference.rtt', stamp='DRAFT'),
]
```

#### `rinoh_targets`

Limits rendering to the specified set of targets. This variable accepts either a list of strings or a string containing comma-separated values. The target names should match those set in `rinoh_documents`.

To render only the ‘manual’ target, you can set the following in `conf.py`:

```
rinoh_targets = ['manual']
```

The same can be achieved from the command line using the by using the string form with `sphinx-build -D`:

```
spinx-build -b rinoh -D rinoh_targets="manual" source build
```

## 2.1 Legacy Configuration Variables

The configuration variables below are no longer supported. Instead, their functionality can now be configured per document in `rinoh_documents`.

#### `rinoh_template`

This configuration variable is **no longer supported** since the document template can be specified in `rinoh_documents` entries.

#### `rinoh_stylesheet`

This configuration variable is **no longer supported** since it is not obvious which style sheet will be used when the template configuration also specifies a style sheet. Please specify the style sheet to use in your template configuration file:

```
[TEMPLATE_CONFIGURATION]
name = My Book
template = book
stylesheet = my_stylesheet.rts
```

#### `rinoh_paper_size`

This configuration variable is **no longer supported** since it was not obvious which paper size was being used when the template configuration (`rinoh_template`) also specified a paper size. Please specify the `paper_size` to use in your template configuration file:

```
[TEMPLATE_CONFIGURATION]
name = My Book
template = book
```

```
[VARIABLES]
```

```
paper_size = A5
```

#### **rinoh\_logo**

This configuration variable is **no longer supported** since the logo can be specified in the `rinoh_documents` entries.

#### **rinoh\_domain\_indices**

This configuration variable is **no longer supported** since the domain\_indices can be specified in the `rinoh_documents` entries.

#### **rinoh\_metadata**

This configuration variable is **no longer supported**. Metadata entries can now be added to `rinoh_documents` entries.

## 3.1 Included Style Sheets

These style sheets are included with rinohtype:

`rinoh.stylesheets.sphinx`

Mostly a copy of the LaTeX style included with Sphinx  
Entry point name: `sphinx`

`rinoh.stylesheets.sphinx_article`

The Sphinx stylesheet adjusted for the article template  
Entry point name: `sphinx_article`

`rinoh.stylesheets.sphinx_base14`

The Sphinx stylesheet, but using the fonts from the PDF core set (yielding smaller PDF files)  
Entry point name: `sphinx_base14`

Additional style sheets can be installed from PyPI. The installed style sheets can be listed using  
`rinoh --list-stylesheets`.

## 3.2 Default Matcher

The default matcher provides the selectors for the styles used in the standard style sheets.

`rinoh.stylesheets.matcher`

The default matcher defines the following styles

- `title page rule`: `HorizontalRuleStyle`
- `title page logo`: `FlowableStyle`
- `title page title`: `ParagraphStyle`
- `title page subtitle`: `ParagraphStyle`
- `title page author`: `ParagraphStyle`

# Standard Document Templates

4

Rinohype includes a number of document templates. These are configurable and therefore should cater for most documents.

## 4.1 Article

The article template consists of a title page, an optional table of contents and the body text. By default, it uses a single numbering style for all pages and the same template for even and odd pages.

```
class rinoh.templates.article.Article ( document_tree, configuration=None, backend=None )

## 5.3 Dimension (`rinoh.dimension`)

Classes for expressing dimensions: lengths, widths, line thickness, etc.

Each dimension is expressed in terms of a unit. Several common units are defined here as constants. To create a new dimension, multiply number with a unit:

```
height = 100*PT
width = 50*PERCENT
```

Fractional dimensions are evaluated within the context they are defined in. For example, the width of a `Flowable` is evaluated with respect to the total width available to it.

```
class rinoh.dimension.Dimension( value=0, unit=None )
    A simple dimension
```

Parameters

**value : int or float**

the magnitude of the dimension

**unit : DimensionUnit**

the unit this dimension is expressed in. Default: PT.

**grow( value )**

Grow this dimension (in-place)

The value is interpreted as a magnitude expressed in the same unit as this dimension.

Parameters

**value : int or float**

the amount to add to the magnitude of this dimension

Returns

Dimension – this (growed) dimension itself

```
rinoh.dimension.PT = DimensionUnit(1.0, 'pt')  
PostScript points
```

```
rinoh.dimension.PICA = DimensionUnit(12.0, 'pc')

```
class rinoh.flowable.Flowable ( align=None, width=None, id=None, style=None,

        the width of the flowable.

class rinoh.flowable.FlowableState ( flowable, _initial=True )
    Stores a flowable’s rendering state, which can be copied.
    This enables saving the rendering state at certain points in the rendering process, so
rendering can later be resumed at those points, if needed.
```

### 5.6.1 No-Output Flowables

These flowables do not directly place anything on the page. All except `DummyFlowable` do have side-effects however. Some of these side-effects affect the rendering of the document in an indirect way.

```
class rinoh.flowable.DummyFlowable ( id=None, parent=None, source=None )
```

A flowable that does not directly place anything on the page.

Subclasses can produce side-effects to affect the output in another way.

```
class rinoh.flowable.AnchorFlowable ( id=None, parent=None, source=None )
```

A dummy flowable that registers a destination anchor.

Places a destination for the flowable's ID at the current cursor position.

```
class rinoh.flowable.SetMetadataFlowable ( parent=None, **metadata )
```

A dummy flowable that stores metadata in the document.

The metadata is passed as keyword arguments. It will be available to other flowables during the rendering stage.

```
class rinoh.flowable.WarnFlowable ( message, parent=None, source=None )

```
class rinoh.flowable.LabeledFlowable ( label, flowable, id=None, style=None, parent=None )

**flowable : Flowable**

the flowable to label

**style\_class**

alias of `LabeledFlowableStyle`

**prepare ( flowable\_target )**

```
render ( container, last_descender, state, label_column_width=None, space_below=0, **kwargs )
```

Renders the flowable's content to `container`, with the flowable's top edge lining up with the container's cursor. `descender` is the descender height of the preceding line or `None`.

```
class rinoh.flowable.LabeledFlowableState ( flowable, content_flowable_state, _initial=True )
```

### 5.6.3 Grouping Flowables

```
class rinoх.flowable.GroupedFlowables ( align=None, width=None, id=None,
style=None, parent=None, source=None )  
    Groups a list of flowables and renders them one below the other.  
    Makes sure that a flowable for which keep_with_next is enabled is not seperated from  
    the flowable that follows it.  
    Subclasses should implement flowables().

        Renders the flowable's content to container, with the flowable's top edge lining up with  
        the container's cursor. descender is the descender height of the preceding line or None.  
  
class rinoх.flowable.GroupedFlowablesState ( groupedflowables, flowables,  
first_flowable_state=None, _initial=True, _index=0 )  
  
class rinoх.flowable.StaticGroupedFlowables ( flowables, align=None, width=None,

class rinoх.flowable.GroupedLabeledFlowables ( align=None, width=None, id=None,  
style=None, parent=None, source=None )  
    Groups a list of labeled flowables, lining them up.  
  
    render ( container, descender, state, **kwargs )  
        Renders the flowable's content to container, with the flowable's top edge lining up with  
        the container's cursor. descender is the descender height of the preceding line or None.
```

### 5.6.4 Floating Flowables

```
class rinoх.flowable.Float ( align=None, width=None, id=None, style=None, parent=None,  
source=None )  
    A flowable that can optionally be placed elsewhere on the page.  
    If this flowable's float style attribute is set to True, it is not flowed in line with  
    the surrounding flowables, but it is instead flowed into another container pointed to by  
    the former's Container.float_space attribute.
```

This is typically used to place figures and tables at the top or bottom of a page, instead of in between paragraphs.

**style\_class**

alias of `FloatStyle`

**flow( container, last\_descender, state=None, \*\*kwargs )**

Flow this flowable into `container` and return the vertical space consumed.

The flowable's contents are preceded by a vertical space with a height as specified in its style's `space_above` attribute. Similarly, the flowed content is followed by a vertical space with a height given by the `space_below` style attribute.

the style to associate with this element. If style is a string, the corresponding style  
is looked up in the document's style sheet by means of selectors.  
  
style_class  
The Style subclass that corresponds to this Styled subclass.

### 5.17.1 Style Sheet

```

class rinoх.style.StyleSheet ( name, matcher=None, base=None, source=None, description=None, pygments_style=None, **user_options )
    Dictionary storing a collection of related styles by name.
    Styles stored in a StyleSheet can refer to their base style by name.

Parameters
    name : str
        a label for this style sheet
    matcher : StyledMatcher
        the matcher providing the selectors the styles contained in this style sheet map to.
        If no matcher is given and base is specified, the base's matcher is used. If base is not set, the default matcher is used.
    base : StyleSheet or str
        the style sheet to extend
    description : str
        a short string describing this style sheet
    pygments_style : str
        the Pygments style to use for styling code blocks

Parameters
    name : str
        a style name

Returns
    Selector – the selector mapped to the style name

Raises
    KeyError – if the style name was not found in this or a base style sheet

class rinoх.style.StyleSheetFile ( filename, base=None, source=None, **kwargs )
    Loads styles defined in a .rts file (INI format).

```

## Parameters

### filename : str

the path to the style sheet file

StyleSheetFile takes the same optional arguments as StyleSheet. These can also be specified in the [STYLESHEET] section of the style sheet file. If an argument is specified in both places, the one passed as an argument overrides the one specified in the style sheet file.

```
class rinoh.style.StyledMatcher( mapping_or_iterable=None, **kwargs )
```

Dictionary mapping labels to selectors.

This matcher can be initialized in the same way as a dict by passing a mapping, an iterable and/or keyword arguments.

**update** ( \*\*F [, E] ) → None. Update D from mapping/iterable E and F.

If E is present and has a .keys() method, then does: for k in E.keys(): D[k] = E[k] If E is present and lacks a .keys() method, then does: for k, v in E: D[k] = v In either case, this is followed by: for k in F: D[k] = F[k]

    alias of DocumentTemplateConfigurationFile

Document templates can be customized by setting values for the configuration attributes defined in a DocumentTemplate subclass in a TemplateConfiguration. A template configuration can be passed as configuration on template instantiation. However, it is better to make use of the document method, however.

```

class rinoх.template.TemplateConfiguration (name, base=None, source=None,  

template=None, description=None, **options)
    Stores a configuration for a DocumentTemplate

Parameters
    name : str
        a label for this template configuration
    base : TemplateConfiguration
        the template configuration to extend
    source : str
        the source of this configuration (e.g. a file path)

```

```

```

template : DocumentTemplateMeta or str
    the document template to configure
description : str
    a short string describing this style sheet
**options
    configuration values for the configuration attributes defined by the document
    template
template = None
    The DocumentTemplate subclass to configure
document ( document_tree, backend=None )
    Create a DocumentTemplate object based on the given document tree and this
    template configuration
    Parameters
        document_tree : DocumentTree
            tree of the document's contents
        backend=None
            the backend to use when rendering the document
class rinoх.template.PartsList (*parts)
    Stores the names of the document part templates making up a document
    Parameters
        parts : list[str]
            the names of the document parts

```

## 5.19.2 Document Parts

```

class rinoх.template.DocumentPart ( template, document, flowables, last_number_format )
    Part of a document.
    Parameters
        template : DocumentPartTemplate
            the template that determines the contents and style of this document part
        document : Document
            the document this part belongs to
        flowables : list[Flowable]
            the flowables to render in this document part
        configuration_class
            alias of DocumentPartTemplate
        add_page ( page )
            Append page (Page) to this DocumentPart.
        new_page ( page_number, chain, new_chapter, sideways=False )
            Called by render() with the Chain's that need more
            :class:`Container`'s. This method should create a new
            :class:`Page` which contains a container associated with chain.

```

The document part templates which are listed by name in DocumentTemplate.parts are looked up as attributes of the DocumentTemplate subclass. They are instances of DocumentPartTemplate subclasses:

```
class rinoh.template.DocumentPartTemplate( base=None, **attributes )  
    A template that produces a document part  
    The document part is created given a set of flowables, and page templates. The latter are  
    looked up in the TemplateConfiguration where this part template was.
